PROTOCOL

swiftbiosci.com

ACCEL-NGS® 1S PLUS DNA LIBRARY KIT

Single, Dual Combinatorial and Unique Dual Indexing

Protocol for Cat. Nos. 10024 and 10096 to be used with:

- 1S Plus Set A Indexing Kit (Cat. No. 16024)
- 1S Dual Combinatorial Indexing Kit (Cat. No. 18096)
- 1S Unique Dual Indexing Kit (24 indices, 96 rxns - Cat. No. 19096)
- 1S Unique Dual Indexing Kit (96 indices, 384 rxns - Cat. No. 190384)

Visit swiftbiosci.com/protocols for updates.

About This Guide

This guide provides instructions for the preparation of high complexity next-generation sequencing (NGS) libraries from single-stranded DNA (ssDNA) and double-stranded DNA (dsDNA) using an Accel-NGS 1S Plus DNA Library Kit. This kit is suitable for NGS library prep with Single, Dual Combinatorial or Unique Dual Indexing.

IMPORTANT!
Read the entire Protocol before use, especially the sections pertaining to Product Information, Kit Contents, Material and Equipment Not Included, and Input Material Considerations.

Product Information

The Accel-NGS 1S Plus DNA Library Kit enables the preparation of high complexity NGS libraries from ssDNA and dsDNA for sequencing on Illumina® platforms. The 1S Plus technology utilizes Illumina-compatible adapter sequences and has been validated for viral, microbial, and human whole genome sequencing (WGS).

Libraries can be made from 10 pg–250 ng of high quality starting input gDNA. The technology powering the Accel-NGS 1S Plus Kit is compatible with ssDNA, making it an ideal choice for NGS library prep from samples containing damaged, denatured, or otherwise single-stranded DNA. The Accel-NGS 1S Plus Kit does not require intact dsDNA. This empowers users of the Accel-NGS 1S Plus DNA Library Kit to use damaged and ssDNA/dsDNA mixed samples.

IMPORTANT!
Please consider genome complexity and sample quality when choosing input DNA quantity. Although libraries may be successfully prepared from ultra-low inputs, reduced representation of genome complexity may occur.

It is recommended to use the highest input available for best results. The Accel-NGS 1S Plus Kit has been validated with up to 250 ng of starting input material. If using more than 250 ng of input material, please contact Technical Support for recommended modifications to the Protocol.

Applications

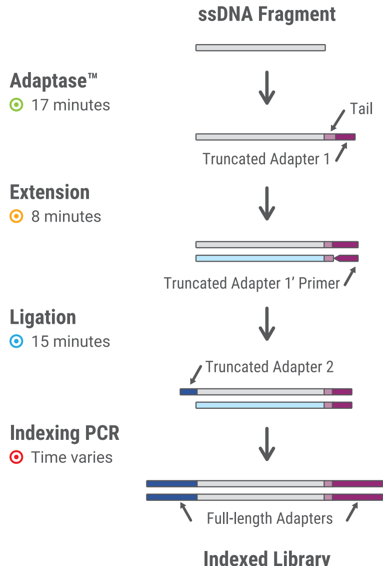
The Accel-NGS 1S Plus DNA Library Kit is suitable for the following applications:

- WGS
- DNA enriched by ChIP or other methods*†
- Sequencing ancient DNA samples when retention of fragments containing uracil nucleotides as a result of damage is not desired†
- Samples with a mixture of ssDNA and dsDNA
- Heat denatured samples
- Viral genomics and quantification of ssDNA and dsDNA viromes
- RNA-seq with first-strand cDNA
- Hybridization capture using a variety of available capture probes*†

**Enrichment methods generally require higher input quantities.*

† For samples containing small DNA fragments, like ancient DNA samples, modified bead ratios can be used to retain fragments as small as 40 bases (see Appendix, Section A).

Accel-NGS 1S Plus DNA Library Kit Workflow



This protocol sequentially attaches adapters to ssDNA fragments.

The Adaptase step is a highly efficient, template-independent reaction that simultaneously performs tailing and ligation of truncated adapter to 3' ends.

The Extension step is used to incorporate truncated adapter 1 by a primer extension reaction.

The Ligation step is used to add truncated adapter 2 to the **top strand only**.

The Indexing PCR step increases yield and incorporates full length adapters for single or dual indexing.

Bead-based clean-ups are used to remove both oligonucleotides and small fragments, as well as to change enzymatic buffer composition.

Kit Contents

The Accel-NGS 1S Plus DNA Library Kit is available in two sizes with reagents (10% excess volume) for the preparation of either 24 or 96 libraries. Reagent R1 (IX) (Single Indexing Primer mixture), D50X/D7XX (Combinatorial Dual Index Primers) or U001-U096 (Unique Dual Index Primers) are provided separately in one of the available Accel-NGS 1S Plus Indexing Kits (see Appendix, Section C).

Reagents	Quantity (μl)		Storage (°C)
	24 rxn	96 rxn	
Buffer G1	106	423	-20
Reagent G2	106	423	-20
Reagent G3	66	264	-20
Enzyme G4	27	106	-20
Enzyme G5	27	106	-20
Enzyme G6	27	106	-20
Reagent Y1	53	212	-20
Reagent W2	291	1162	-20
Buffer W3	726	2904	-20
Enzyme W4	80	317	-20
Buffer B1	106	423	-20
Reagent B2	264	1056	-20
Enzyme B3	53	212	-20

IMPORTANT!
Place the enzymes on ice, NOT in a cryocooler, for at least 10 minutes to allow enzymes to reach 4 ˚C prior to pipetting.

Reagents	Quantity (mL)	Storage (°C)
Low EDTA TE	20	Room Temp

Indexing Reagents Provided Separately

Reagents	Volume per rxn	Quantity (μl)			Storage (°C)
		24 rxn	96 rxn	384 rxn	
Single Index Reagent R1 (IX)	5	11	—	—	-20
Combinatorial Dual Index (D50X/D7XX)	2.5 + 2.5	—	33/22	—	-20
Unique Dual Index (U001-U024)	5	—	22	—	-20
Unique Dual Index (U001-U096)	5	—	—	22	-20

Material and Equipment Not Included

- A compatible Accel-NGS 1S Plus Indexing Kit [Reagent R1 (IX), Index D50X/D7XX, or Index U001-U096)]
- Magnetic beads for clean-up steps, e.g., SPRIselect™ beads (Beckman Coulter, Cat. No. B23317/B23318/B23319)
- Magnetic rack for clean-up steps, e.g., Invitrogen DynaMag™ or Agencourt® SPRIPlate™
- Library quantification kit
- Qubit® or other fluorometric-based assays for determining dsDNA concentration
- NanoDrop® or other device for determining ssDNA concentration
- Method for fragmentation of input DNA by mechanical or enzymatic shearing
- Microfuge
- Programmable thermocycler
- 0.2 mL PCR tubes
- 1.5 mL low retention microfuge tubes
- Aerosol-resistant, low retention pipettes and tips, 2 to 1000 µL
- 200-proof/absolute ethanol (molecular biology-grade)
- Nuclease-free water (molecular biology-grade)

Storage and Usage Warning

Upon receipt, store the Accel-NGS 1S Plus DNA Library Kit products at -20 ˚C with the exception of Low EDTA TE solution, which is stored at room temperature.

To maximize use of enzyme reagents when ready to use, remove enzyme tubes from -20 ˚C storage and place on ice, NOT in a cryocooler, for at least 10 minutes to allow enzymes to reach 4 ˚C prior to pipetting. Attempting to pipette enzymes at -20 ˚C may result in a shortage of enzyme reagents.

After thawing reagents to 4 ˚C, briefly vortex (except the enzymes) to mix them well. Spin all tubes in a microfuge to collect contents prior to opening.

IMPORTANT!

- Assemble all reagent master mixes ON ICE and scale volumes as appropriate, using 5% excess volume to compensate for pipetting loss. To calculate the total volume of the master mixes, use our Accel-NGS 1S Plus Master Mixing Volume Calculator, and prepare them in advance to ensure the magnetic beads do not over-dry during size selection steps.
- Always add reagents to the master mix in the specified order as stated throughout the Protocol. Reagent R1 (IX), D50X/D7XX (combinatorial dual index primers) or U001-U096 (unique dual index primer) are the only reagents that are added individually to each sample.

Tips and Techniques

Size Selection During Clean-Up Steps

This protocol has been validated with SPRIselect beads (Beckman Coulter), but can be used with Agencourt AMPure® XP (Beckman Coulter). If other beads are used, solutions and conditions for DNA binding may differ. Consider the information below for performing efficient size selection:

- Prior to performing the library preparation workflow, analyze the samples' size distribution by electrophoretic methods to determine the median fragment size of your dsDNA samples.
- The size selections utilized in this protocol perform a Left Side Size Selection to remove small fragments and unused adapter (see Appendix, Section A for modified bead ratios to retain fragments as small as 40 bp). For customizing size selection, please use Beckman Coulter's SPRIselect User Guide for desired conditions not included in this protocol.

IMPORTANT!
For optimal removal of undesirable small fragments and unused adapter, users should perform clean-up steps in 1.5 mL tubes using 500 µl of 80% ethanol solution to wash the beads. However, for inputs ≥ 1 ng, adequate small fragment and unused adapter removal can be achieved by clean-up steps performed in 0.2 mL PCR tubes using 180 µl of 80% ethanol solution to wash the beads.

Recommended PCR Cycles

Below are examples of recommended PCR cycles for high quality genomic DNA for direct sequencing. Yields are approximate and will vary between sample types.

Input Material	Input Quantity (ng)	PCR Cycles	Average Yield (nM)
gDNA	250	3-5	≥ 4
	100	4-6	≥ 4
	10	7-9	≥ 4
	1	10-12	≥ 4
	0.1	14-16	≥ 4
	0.01	17-19	≥ 4

Prepare the DNA Sample

Input DNA Quantification

Concentration may be assessed using NanoDrop with A_{260}/A_{280} ratio or another absorbance-based method; or, if samples are dsDNA, by using Qubit or another fluorometric-based method. Accurate determination of DNA input amount is important for determining the number of PCR cycles required at the end of the protocol. For low quality DNA samples, we recommend quantification by qPCR using the Alu primer pairs provided in this kit (see Input DNA Quantification Assay) to accurately assess the usable amount of DNA in the samples and their integrity.

High Quality gDNA Quantify with Qubit or similar fluorometric method
ChIP DNA (*Optional*) Quantify with Qubit or similar fluorometric method
FFPE DNA Quantify by qPCR with Alu primer pairs (see Input DNA Quantification Assay)

- We recommend using between 10 pg-250 ng input DNA per library preparation.
- After determining DNA concentration, proceed directly to the DNA fragmentation step.

IMPORTANT!
- Input quantities referenced in this Protocol refer to total DNA quantified prior to DNA fragmentation.

DNA Fragmentation

If working with samples that have already undergone mechanical or enzymatic fragmentation, such as ChIP DNA, this step may be omitted.

Input Material	Fragmentation	Supported Fragment Size (bp)
High Quality gDNA	✓	200, 350
ChIP DNA	–	200, 350
FFPE DNA	✓	200, 350

When working with high molecular weight genomic DNA, the DNA must be fragmented prior to library preparation. Fragmentation may be performed via mechanical shearing, such as sonication, or through enzymatic digestion methods to produce 350 or 200 bp DNA fragments. If using other fragment size, please contact TechSupport@swiftbiosci.com for clean-up bead ratio recommendations. This kit has been specifically validated using Covaris®-fragmented DNA.

We recommend analyzing the sheared DNA samples prior to library preparation using electrophoretic methods.

Optional Concentration Step

If you have performed enzymatic fragmentation or your fragmented DNA concentration is too low to provide sufficient quantity in the 15 µl DNA starting volume specified in the Adaptase step, concentrate with Zymo Research DNA Clean & Concentrator™ or other method and elute in 15 µl of Low EDTA TE buffer. Otherwise, proceed directly to the Denaturation Step.

IMPORTANT!

The first step of the Accel-NGS 1S Plus library prep requires a DNA volume of 15 µl. Be sure to note the volume for final elution of DNA in Low EDTA TE solution to prevent sample over-dilution.

Prepare the Reagent Master Mixes and Ethanol

1. To create the master mix, scale reagent volumes as appropriate, using 5% excess volume to compensate for pipetting loss. To calculate the total volume of the master mixes based on the number of reactions of choice, use our Accel-NGS 1S Plus Master Mixing Volume Calculator. This tool automatically incorporates 5% excess volume to compensate for pipetting loss.
2. To assemble reagent master mixes for the Adaptase, Extension, Ligation, and Indexing PCR steps, ensure the reagent vials are at room temperature and enzymes are at 4 °C. After thawing reagents, briefly vortex (except the enzymes) to mix them well. Spin tubes in a microfuge to collect contents prior to opening. Add reagents in order listed when preparing master mix. Once prepared, master mixes should be stored ON ICE until used.
3. Prepare a fresh 80% ethanol solution using 200-proof/absolute ethanol and nuclease-free water. Approximately 2.0 mL of 80% ethanol solution will be used per sample.

IMPORTANT!

Prepare the reagents in advance to ensure the magnetic beads do not dry out during size selection steps. Always add reagents in specified order. This applies to all reagents except for the indexed adapter primers provided separately in the indexed adapter kit that should be added individually to uniquely index each library.

Prepare the DNA Libraries

Denaturation

1. Due to the short incubation time of the Denaturation step, pre-assemble all of the reagents of the Adaptase Reaction Mix (see next step for recipe), and place on ice.
2. Pre-heat the thermocycler to 95 °C.
3. Transfer the fragmented DNA sample to a 0.2 mL PCR tube and adjust the volume of the sample to a final volume of 15 µl using Low EDTA TE, if necessary.
4. Place the samples in the thermocycler, programmed at 95 °C for 2 minutes with lid heating ON.
5. Upon completion, place tube(s) on ice immediately for 2 minutes. Proceed directly to the Adaptase step to preserve the maximum amount of ssDNA substrate.

Adaptase

6. Load the Adaptase Thermocycler Program on the thermocycler and pause it at the first step to pre-heat to 37 °C until all samples are loaded.

Assembly Order	Reagents	Volume per Sample
Pre-assemble	Low EDTA TE	11.5 µl
	Buffer G1	4.0 µl
	Reagent G2	4.0 µl
	Reagent G3	2.5 µl
	Enzyme G4	1.0 µl
	Enzyme G5	1.0 µl
	Enzyme G6	1.0 µl
	Total Volume	**25.0 µl**

7. Add 25 µl of the pre-assembled Adaptase Reaction Mix to each PCR tube containing a 15 µl DNA sample and mix by pipetting or gentle vortexing until homogeneous. Spin down.
8. Place the samples in the thermocycler and run the program, with **lid heating ON**.

Thermocycler Program
37 °C, 15 min
95 °C, 2 min
4 °C hold

Extension

9. Load the Extension Thermocycler Program on the thermocycler and pause it at the first step to pre-heat to 98 °C until all samples are loaded.
10. Add 47 µl of the already pre-mixed Extension Reaction Mix (listed in the table below) to each PCR tube containing 40 µl of the Adaptase Reaction, using reagents in the order listed.

Assembly Order	Reagents	Volume per Sample
Pre-assemble	Low EDTA TE	18.5 µl
	Reagent Y1	2.0 µl
	Reagent W2	7.0 µl
	Buffer W3	17.5 µl
Add just before use	Enzyme W4	2.0 µl
	Total Volume	**47.0 µl**

11. Mix by pipetting or gentle vortexing until homogenous. Spin down.
12. Place the samples in the thermocycler and run the program, with **lid heating ON**.

Thermocycler Program
98 °C, 30 sec
63 °C, 15 sec
68 °C, 5 min
4 °C hold

13. Transfer each sample to a 1.5 mL tube and clean up the Extension Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Input	Number of Clean-ups	Sample Volume	Bead Volume	Elution Volume
≥ 1 ng, 200 bp	Single clean-up	87 µl	104 µl (ratio: 1.2)	20 µl
≥ 1 ng, 350 bp	Single clean-up	87 µl	70 µl (ratio: 0.8)	20 µl
< 1 ng, 200 bp	1st clean-up	87 µl	104 µl (ratio: 1.2)	50 µl
	2nd clean-up	50 µl	60 µl (ratio: 1.2)	20 µl
< 1 ng, 350 bp	1st clean-up	87 µl	70 µl (ratio: 0.8)	50 µl
	2nd clean-up	50 µl	40 µl (ratio: 0.8)	20 µl

Safe Stopping Point

Store eluate at 4 °C until ready to proceed.

Ligation

14. Add 20 µl of the pre-mixed Ligation Reaction Mix (listed in the table below) to a new PCR tube containing 20 µl of the Post-Extension eluate. For the Ligation Reaction Mix, use reagents in the order listed below and note **Enzyme B3 should be added to the master mix just before use**.

Assembly Order	Reagents	Volume per Sample
Pre-asemble	Low EDTA TE	4 µl
	Buffer B1	4 µl
	Reagent B2	10 µl
Add just before use	Enzyme B3	2 µl
	Total Volume	**20 µl**

15. Mix by pipetting or gentle vortexing until homogenous. Spin down.
16. Place the samples in the thermocycler programmed at 25 °C for 15 minutes with **lid heating ON,** followed by a 4 °C hold
17. Transfer each sample to a 1.5 mL tube and clean up the Ligation Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Input	Sample Volume	Bead Volume	Elution Volume
All Inputs, 200 bp	40 µl	40 µl (ratio: 1.0)	20 µl
All Inputs, 350 bp	40 µl	32 µl (ratio: 0.8)	20 µl

Safe Stopping Point

Store eluate at 4 ºC until ready to proceed.

Indexing PCR

18. Add 5 µl of the appropriate indexed adapter primer(s) directly to each sample.

Reagents	Volume Added to Each Sample (Using Cat. No. 16024)	Volume Added to Each Sample (Using Cat. No. 18096)	Volume added to each sample (Using Cat. No 19096 and 190384)
Reagent R1 (IX)	5 µl	–	–
Index D50X	–	2.5 µl	–
Index D7XX	–	2.5 µl	–
Index U001-U096	–	–	5 µl

IMPORTANT!

The indexed adapter primers are provided separately as part of the Indexed Adapter Kit.

19. Add 25 µl of the already pre-mixed Indexing PCR Reaction Mix (listed in the table below) to each PCR tube containing 25 µl of sample, using reagents in the order listed below. **Enzyme W4 should be added to the master mix just before use.**

Assembly Order	Reagents	Volume per Sample
Pre-assemble	Low EDTA TE	10 µl
	Reagent W2	4 µl
	Buffer W3	10 µl
Add just before use	Enzyme W4	1 µl
	Total Volume	**25 µl**

20. Mix by pipetting or gentle vortexing until homogenous. Spin down.
21. Place the samples in the thermocycler and run the program, with **lid heating ON**.

IMPORTANT!

The number of cycles required to produce enough library for sequencing will depend on input quantity and quality. In the case of low quality samples including FFPE, the number of cycles required may vary based on the quality of the sample and amount of usable DNA present. Approximate guidelines for high quality DNA are as indicated below, but the exact number of cycles required must be determined by the user.

Input	Recommended PCR Cycles	Thermocycler Program
250 ng	3-5	98 °C for 30 seconds PCR Cycles: 98 °C for 10 seconds 60 °C for 30 seconds 68 °C for 60 seconds Hold at 4 °C
100 ng	4-6	
10 ng	7-9	
1 ng	10-12	
0.1 ng	14-16	
0.01 ng	17-19	

22. Transfer each sample to a 1.5 mL tube and clean up the Indexing PCR Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Input	Sample Volume	Bead Volume	Elution Volume
All Inputs, 200 bp	50 µl	42.5 µl (ratio: 0.85)	20 µl
All Inputs, 350 bp	50 µl	42.5 µl (ratio: 0.85)	20 µl

Perform two SPRI clean ups instead of one if sequencing on patterned flow cells, according to the following specifications.

Input	Number of Clean-ups	Sample Volume	Bead Volume	Elution Volume
All inputs, 200 bp	1st clean-up	50 µl	42.5 µl (ratio: 0.85)	50 µl
	2nd clean-up	50 µl	42.5 µl (ratio: 0.85)	20 µl
All inputs 350 bp	1st clean-up	50 µl	42.5 µl (ratio: 0.85)	50 µl
	2nd clean-up	50 µl	42.5 µl (ratio: 0.85)	20 µl

This modification is recommended only if sequencing on patterned flow cells because reduction of indexing PCR primer carryover into the ExAmp clustering reaction reduces index hopping overall. This modification is not required if sequencing on non-patterned flow cells.

Safe Stopping Point

Store freshly prepared libraries at 4 ˚C. The library is now ready for quantification and sequencing.

Sequence the DNA Libraries

Library Quantification

Accurate library quantification is essential to properly load the sequencing instrument. Libraries can be quantified using electrophoresis- or qPCR-based methods. Electrophoresis-based methods also allow examination of library molecule size distribution. There are many commercially-available qPCR kits available for library quantification.

Following the recommended PCR cycles will result in a library concentration of at least 4 nM.

Instrument Compatibility

Libraries prepared with the Accel-NGS 1S Plus DNA Library Kit should be sequenced as follows. These precautions consistently lead to highly successful sequencing runs with Q-scores above 90%:

- **MiniSeq®:** Use a 25% spike in of PhiX or a balanced, high complexity library.
- **MiSeq®:** Use MiSeq Software Updater V2.2.0.2 (containing RTA v.1.17.28 rel. 3/18/13) or later.
- **NextSeq® 500:** Use a 25% spike in of PhiX or a balanced, high complexity library.
- **HiSeq® 2500:** Use a 10% spike in of Phix or a balanced, high complexity library.

These recommendations are subject to change, depending on the version of sequencer software. Please contact Illumina technical support for recommendations.

IMPORTANT!

To ensure optimal mapping efficiency and precise methylation information, bioinformatic trimming of the low complexity “Adaptase tail” from these libraries is required. See Appendix, Section D.

Appendix

Section A: Small Fragment (≥ 40 bp) Retention

Modifications to the standard Accel-NGS 1S Plus protocol are necessary when constructing libraries from samples with small fragments. Please use these bead volumes to retain DNA fragments as small as 40 bp. This may result in increased adapter dimer presence in the final library.

1-12. For steps 1-12, follow the instructions outlined in the standard protocol.

13. Transfer each sample to a 1.5 mL tube and clean up the Extension Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Sample Volume	Bead Volume	Elution Volume
87 µl	157 µl (ratio: 1.8)	20 µl

14-16. For steps 14-16, follow the instructions outlined in the standard protocol.

17. Transfer each sample to a 1.5 mL tube and clean up the Ligation Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Sample Volume	Bead Volume	Elution Volume
40 µl	64 µl (ratio: 1.6)	20 µl

18-21. For steps 18-21, follow the instructions outlined in the standard protocol.

22. Transfer each sample to a 1.5 mL tube and clean up the Indexing PCR Reaction using beads and freshly prepared 80% ethanol. See Appendix, Section B for instructions. Follow the clean-up instructions below.

Sample Volume	Bead Volume	Elution Volume
50 µl	80 µl (ratio: 1.6)	20 µl

Perform two SPRI clean-ups instead of one if sequencing on patterned flow cells, according to the following specifications.

Number of Clean-ups	Sample Volume	Bead Volume	Elution Volume
1st clean-up	50 µl	80.0 µl (ratio: 1.6)	50 µl
2nd clean-up	50 µl	80.0 µl (ratio: 1.6)	20 µl

Section B: Size Selection/Clean-up Protocol

Please use the following protocol for each clean-up step, substituting the correct **Sample Volume**, **Bead Volume**, and **Elution Volume** based on the table provided for each section.

1. Ensure the magnetic beads are at room temperature and vortex beads to homogenize the suspension before use.
2. Transfer each Sample Volume to a 1.5 mL tube.
3. Add the specified Bead Volume to each sample. Mix by vortexing. Quick spin the samples in a tabletop microcentrifuge.
4. Incubate the samples for 5 minutes at room temperature (off the magnet).
5. Place the sample on a magnetic rack until the solution clears and a pellet is formed (~ 2 minutes).
6. Remove and discard the supernatant without disturbing the pellet (less than 5 µl may be left behind). Leave the tubes on the magnet.
7. Add 500 µl of freshly prepared 80% ethanol solution to the sample while it is still on the magnetic rack. Use care not to disturb the pellet. Incubate for 30 seconds, and then carefully remove the ethanol solution.
8. Repeat step 7 once more for a second wash with the 80% ethanol solution.
9. Quick spin the samples in a tabletop microcentrifuge and place back on the magnetic rack. Remove any residual ethanol solution from the bottom of the tube.
10. Add the specified Elution Volume of Low EDTA TE buffer and re-suspend the pellet. Mix well by pipetting up and down until homogenous. Incubate at room temperature for 2 minutes off the magnet, then place the tube on the magnet.
11. Transfer the entire eluate to a new 0.2 mL PCR tube. Ensure that eluate does not contain magnetic beads (indicated by brown coloration in the eluate). If magnetic beads are present, pipette eluate into a new tube, place on magnet, and transfer eluate again.

Post-Extension Clean-Up

Input	Number of Clean-ups	Sample Volume	Bead Volume	Elution Volume
≥ 1 ng, 200 bp	Single clean-up	87 µl	104 µl (ratio: 1.2)	20 µl
≥ 1 ng, 350 bp	Single clean-up	87 µl	70 µl (ratio: 0.8)	20 µl
< 1 ng, 200 bp	1st clean-up	87 µl	104 µl (ratio: 1.2)	50 µl
	2nd clean-up	50 µl	60 µl (ratio: 1.2)	20 µl
< 1 ng, 350 bp	1st clean-up	87 µl	70 µl (ratio: 0.8)	50 µl
	2nd clean-up	50 µl	40 µl (ratio: 0.8)	20 µl

Post-Ligation Clean-Up

Input	Sample Volume	Bead Volume	Elution Volume
All Inputs, 200 bp	40 µl	40 µl (ratio: 1.0)	20 µl
All Inputs, 350 bp	40 µl	32 µl (ratio: 0.8)	20 µl

Post-Indexing PCR Clean-Up

Input	Sample Volume	Bead Volume	Elution Volume
All Inputs, 200 bp	50 µl	42.5 µl (ratio: 0.85)	20 µl
All Inputs, 350 bp	50 µl	42.5 µl (ratio: 0.85)	20 µl

Perform two SPRI clean ups instead of one if sequencing on patterned flow cells, according to the following specifications.

Input	Number of Clean-ups	Sample Volume	Bead Volume	Elution Volume
All inputs, 200 bp	1st clean-up	50 µl	42.5 µl (ratio: 0.85)	50 µl
	2nd clean-up	50 µl	42.5 µl (ratio: 0.85)	20 µl
All inputs 350 bp	1st clean-up	50 µl	42.5 µl (ratio: 0.85)	50 µl
	2nd clean-up	50 µl	42.5 µl (ratio: 0.85)	20 µl

Section C: Indexing Kits (Cat. No. 16024, 18096, 19096, and 190384)

During the Indexing PCR step, you must use a unique indexed adapter primer Reagent R1 (IX), D50X/D7XX, or U001-U096 to label each library. If no multiplex sequencing is being performed, all libraries may be labeled with a single index only. Libraries made with uniquely indexed adapters may be multiplexed during cluster generation and co-sequenced on the same Illumina flow cell. The full-length adapter sequences of the single and combinatorial dual indices, where the underlined text is replaced by the indexed adapter sequences in the tables below are as follows.

P5 TruSeq® LT Adapter:

5' AATGATACGGCGACCACCGAGATCTACACTCTTTCCCTACACGACGCTCTTCCGATCT

P7 TruSeq LT Adapter (I2, I4, I5, I6, I7, I12):

5' GATCGGAAGAGCACACGTCTGAACTCCAGTCACXXXXXX(XX)CTCGTATGCCGTCTTCTGCTTG

P7 TruSeq LT Adapter (I13, I14, I15, I16, I18, I19):

5' GATCGGAAGAGCACACGTCTGAACTCCAGTCACXXXXXX(XX)ATCTCGTATGCCGTCTTCTGCTTG

The number on the product tube label indicates which indexed adapter is provided in the tube. The bases in parentheses are not considered part of the 6 bp index sequences, but can be used for 8 bp index reads.

Set A Adapters	Sequence	Cat. No. 16024
Reagent R1 (I2)	CGATGT(AT)	11 µl
Reagent R1 (I4)	TGACCA(AT)	11 µl
Reagent R1 (I5)	ACAGTG(AT)	11 µl
Reagent R1 (I6)	GCCAAT(AT)	11 µl
Reagent R1 (I7)	CAGATC(AT)	11 µl
Reagent R1 (I12)	CTTGTA(AT)	11 µl
Reagent R1 (I13)	AGTCAA(CA)	11 µl
Reagent R1 (I14)	AGTTCC(GT)	11 µl

During library prep, make sure to note which indexed adapter you are using with your sample and do not use the same indexed adapter on two different samples you plan to multiplex together.

Section D: Data Analysis and Informatics

Swift Biosciences' Adaptase technology, used in the Accel-NGS 1S Plus DNA Library Kit, adds a low complexity polynucleotide tail with an average length of 8 bases to the 3' end of each fragment during the addition of the first NGS adapter molecule. If these tails are not trimmed bioinformatically from the sequencing data, it is normal and expected to observe them at the beginning of Read 2 (R2). When read length is close to fragment size, the tail may also be observed toward the end of Read 1 (R1) data.

For specific tail trimming recommendations, please consult our Technical Note titled "Accel-NGS 1S Plus and Methyl-Seq: Tail Trimming for Better Data".

Illumina sequencing chemistry, which uses the initial base of each read to perform cluster registration and establish focus and color balance, is sensitive to low complexity base composition at the start of the read. Therefore, it is important to sequence Accel-NGS 1S Plus libraries on the MiSeq using MiSeq Software Updater v2.2.0.2 (containing RTA v.1.17.28 rel. 3/18/2013) or later. If using the HiSeq in Rapid Run mode, adding a high-complexity spike-in is recommended. These precautions consistently lead to highly successful sequencing runs with Q-scores above 90%. Quality control software, such as FastQC (Babraham Bioinformatics), may raise "per base sequence content" or "per base GC content" flags at the beginning of R2. These flags are expected due to the low complexity tail.

The Accel-NGS 1S Plus Kit adds bases to 3' termini during the Adaptase tailing step. This tail adds artifactual sequence to the dataset. Therefore, trimming is recommended for Accel-NGS 1S Plus libraries to obtain improved mapping efficiency.

Section E: Helpful Information and Troubleshooting

Problem	Possible Cause	Suggested Remedy
Incomplete resuspension of beads after ethanol wash during SPRI™ steps.	Over-drying of beads.	• Continue pipetting the liquid over the beads to break up clumps for complete resuspension.
Shortage of enzyme reagents.	Pipetting enzymes at -20 °C instead of 0-4 °C.	• Allow enzyme reagents to equilibrate to 0-4 °C for 10 minutes prior to pipetting.
Low library yields.	Inaccurate input quantification	• Quantify DNA with Qubit prior to bisulfite conversion
	Significant loss of library following Covaris shearing	• Perform post-shearing clean-up step with 1.8X-2.0X ratio of SPRI beads to maximize recovery of fragmented DNA.
	Low quality sample.	• Use the Alu primers included in the Accel-NGS kit to determine quality of sample and adjust input quantity accordingly.
	Suboptimal performance of SPRI clean-up steps	• Ensure that all residual ethanol is removed by performing a spin down of the beads after the second wash. • Ensure that beads do not over-dry during ethanol wash steps. • Ensure that the reaction warms to room temperature prior to starting SPRI clean-up step. • Ensure adequate time (5 minutes) is allowed for DNA-bead binding while off magnet. • Ensure adequate time (2 minutes) is allowed for resuspension of DNA in Low EDTA TE solution. • Ensure that no eluate is left behind during tube transfer.

If you experience problems with your library prep, please contact us at TechSupport@swiftbiosci.com, or by phone at 734.330.2568 (9:00 am-5:00 pm ET, Monday-Friday).

General Warranty

Swift Biosciences, Inc. ("Swift") warrants that its products meet Swift's specifications at the time of delivery. Any sample or model used in connection with Swift's product literature is for illustrative purposes only and does not constitute a warranty that the products will conform to the sample or model.

To the maximum extent permitted by applicable law, Swift hereby expressly disclaims, and the buyer hereby expressly waives, any warranty regarding results obtained through the use of the products including, without limitation, any claim of inaccurate, invalid, or incomplete results. All other warranties, representations, terms and conditions (statutory, express, implied or otherwise) as to quality, condition, description, merchantability, fitness for purpose, or non-infringement (except for the implied warranty of title) are hereby expressly excluded.

All warranty claims on products must be made in writing within ninety (90) days of receipt of the products. Swift's sole liability and the buyer's exclusive remedy for a breach of this warranty is limited to replacement or refund at the sole option of Swift.

The warranties identified in this paragraph are Swift's sole and exclusive warranties with respect to the products and are in lieu of all other warranties, statutory, express or implied, all of which other warranties are expressly disclaimed, including without limitation any implied warranty of merchantability, fitness for a particular purpose, non-infringement, or regarding results obtained through the use of any product (including, without limitation, any claim of inaccurate, invalid or incomplete results), whether arising from a statute or otherwise in law or from a course of performance, dealing or usage of trade.

Limitation of Liability

Swift Biosciences, Inc. ("Swift") shall have no liability under the warranties cited above with respect to any defect in the products arising from: (i) specifications or materials supplied by the buyer; (ii) wilful damage or negligence of the buyer or its employees or agents; (iii) abnormal working conditions at the buyer's premises; (iv) failure to follow Swift's use restrictions or instructions (whether oral or in writing); (v) misuse or alteration of the products without Swift's approval; or (vi) if the buyer is in breach of its payment obligations in regards to purchasing the products.

To the fullest extent allowed by law, in no event shall Swift be liable, whether in contract, tort, strict liability, negligence, warranty, or under any statute or on any other basis for any special, incidental, indirect, exemplary, punitive, multiple or consequential damages sustained by the buyer or any other person or entity arising out of or caused by product, Swift's performance or failure to perform its obligations relating to the purchase of product or performance of services, Swift's breach of these terms, the possession or use of any product, or the performance by Swift of any services, whether or not foreseeable and whether or not Swift is advised of the possibility of such damages, including without limitation damages arising from or related to loss of use, loss of data, downtime, procurement of substitute products or services, or for loss of revenue, profits, goodwill, or business or other financial loss.

The total liability of Swift arising under or in connection with the purchase of the products, including for any breach of contractual obligations and/or any misrepresentation, misstatement or tortious act or omission (including without limitation, negligence and liability for infringement of any third party intellectual property rights) shall be limited to damages in an amount equal to the amount paid to Swift under the purchase agreement.

The exclusion of liability shall apply only to the extent not prohibited by applicable law.

Notice to Purchaser: Limited License
